

BRADKEN

ENERGY & GHG POLICY

At Bradken, we strive to consistently supply products and services that conform to statutory, regulatory and interested party requirements and are manufactured in a manner that optimises environmental performance, including energy efficiency. We are committed to driving continuous improvement throughout all areas of our business. In particular, we are committed to:

Leadership

Bradken's strategic business plan is developed by its Executive Management Team whose leadership sets the framework for achieving the Company's goals and objectives. Effective control is maintained through the use of formally documented procedures and processes, which describe the responsibilities of all employees who have the authority to intercede in the performance of work.

Good Governance

By ensuring that all Bradken businesses adopt the management systems and operating procedures, which will secure compliance with the spirit of the law, with applicable statutory requirements and the concerns of interested parties. These management systems and operating procedures will identify, monitor and manage the environmental risks and opportunities associated with the energy use and GHG emissions of all Bradken businesses.

Effective Communication

By maintaining open and constructive communication on environmental performance, energy efficiency, GHG emissions and Climate Change matters with staff, employees, government, industry bodies, the community and other interested parties.

Protect the Environment

By adopting practices and setting goals and objectives which minimise any adverse environmental impact of the energy use of its businesses and prevent excessive and unnecessary pollution, in order to achieve a high standard of environmental performance. Where practical and economical, Bradken purchases energy efficient equipment, products and services, ensuring that suppliers and contractors are aware of the company's energy policy and are encouraged to apply a comparable standard of environmental care.

Continuous Improvement

By requiring all businesses in the Bradken Group to continually assess and improve their management systems, production methods and processes to make the most efficient and cost-effective use of resources and energy, minimise waste and emissions, and reduce any adverse environmental impacts by utilising responsible control practices. Reacting to changes in the internal and external environment is necessary for Bradken to continue to improve its environmental performance. This is of paramount importance today as changing environment conditions can evolve rapidly and Bradken must be able to adapt as and when such changes occur.
